32-bit ARM[®] Cortex[®]-M0+ Microcontroller

Puya Semiconductor (Shanghai) Co., Ltd.

Features

- Core
 - ARM® 32-bit Cortex®-M0+ CPU
 - Frequency up to 72 MHz
- Memories
 - Maximum 128 KB Flash memory
 - Maximum 16 KB SRAM
- Clock management
 - 4/8/16/22.12/24 MHz High-speed internal RC oscillator (HSI)
 - 32.768 kHz Low-speed internal RC oscillator (LSI)
 - 4 to 32 MHz High-speed external crystal oscillator (HSE)
 - 32.768 kHz Low-speed external crystal oscillator (LSE)
 - PLL (supports 2/3 multiplication of HSI or HSE)
- Power management and reset
 - Operating voltage: 1.7 ~ 5.5 V
 - Low power modes : Sleep and Stop
 - Power-on/power-down reset (POR/PDR)
 - Brown-out reset (BOR)
 - Programmable voltage detector (PVD)
- General-purpose input and output (I/O)
 - Up to 58 I/Os, all available as external interrupts
- 7-channel DMA controller
- 1 x 12-bit ADC
 - Up to 16 external channels
 - Conversion range: 0 to V_{REF+}
- 2 x 12-bit DAC, supports 2 channels
- 3 x analog comparators
- 3-channel operational amplifier
- Support 8 * 36 / 4 * 40 LCD
- 13 timers
 - 1 x 16-bit advanced-control timer (TIM1)
 - 1 x 32-bit general-purpose timer (TIM2)
 - 5 x 16-bit general-purpose timers (TIM3/14/15/16/17)
 - 2 x basic timers (TIM6/TIM7)
 - 1 x low power timer (LPTIM)
 - 1 x independent watchdog timer (IWDG)
 - 1 x window watchdog timer (WWDG)
 - 1 x SysTick timer
- RTC
- Communication interfaces
 - 2 x serial peripheral interfaces (SPIs) with I²S function
 - 4 x universal synchronous/asynchronous Transceivers (USARTs) , support automatic baud rate detection, two of USARTs support ISO7816, LIN and IrDA
 - 2 x I²C interfaces supporting standard mode (100 kHz), Fast mode (400 kHz), 7-bit/10-bit addressing mode and SMBus
 - USB 2.0 full-speed interface
- Hardware CRC-32 module
- Hardware 32-bit divider (DIV)
- Unique UID
- Serial wire debug (SWD)
- Operating temp.: - 40 ~ 85 °C(x6 version), - 40 ~ 105 °C(x7 version)
- Packages: LQFP64, QFN64, LQFP48, QFN48, QFN32(4*4)

1. Introduction

The PY32F071-E microcontrollers incorporate the high-performance ARM® 32-bit Cortex®-M0+ core operating at up to 72 MHz frequency, embedded memories with up to 128 KB Flash and 16 KB SRAM, and contains various products in different package types. The chip integrates multi-channel I²C, SPI, USART and other communication peripherals, one 12-bit ADC, two DACs, 13 timers, one USB 2.0, three comparators, three operational amplifiers, and one LCD driver.

The PY32F071-E microcontrollers operate in the -40 ~ 85 °C or -40 to 105 °C temperature range, from a 1.7 to 5.5 V power supply, provides Sleep and Stop low-power operating modes, which can meet different low-power applications.

These features make the PY32F071-E microcontrollers suitable for a wide range of applications such as controllers, portable devices, PC peripherals, gaming and GPS platforms, industrial applications.

2. Functional overview

2.1. Arm®-Cortex®-M0+ core

The Arm® Cortex® -M0+ is an entry-level Arm 32-bit Cortex processor designed for embedded applications. It provides developers with significant benefits, including:

- Simple structure, easy to learn and program
- Ultra-low power consumption, energy-saving operation
- Reduced code density and more

The Arm® Cortex-M0+ processor is a 32-bit core optimized for area and power consumption and is a 2-stage pipeline Von Neumann architecture. The processor offers high-end processing hardware, including single-cycle multipliers, through a streamlined but powerful instruction set and an extensively optimized design. Moreover, it delivers the superior performance expected from a 32-bit architecture computer, with a higher coding density than other 8 and 16-bit microcontrollers.

The Cortex-M0+ is tightly coupled with a Nested Vectored Interrupt Controller (NVIC).

2.2. Memories

16 KB of embedded SRAM accessed by Bytes (8 bits), Half-word (16 bits) or Word (32 bits).

The non-volatile memory is divided into two arrays:

- 128 KB of Main flash area for programs and data
- 14 KB of Information area:
 - FT info0 bytes
 - Option bytes
 - UID bytes
 - System memory

The protection of Main flash area includes the following mechanisms:

- Read protection (RDP) prevents outside access.
- Write protection (WRP) prevents unwanted write operation (caused by confusion of program memory pointer from PC). The minimum protection unit for write protection is 8 KB .
- Option byte write protection is a special design for unlock.

2.3. Boot modes

At startup, the BOOT0 pin and boot selector option bit nBOOT are used to select one of the three boot options in the following table:

Table 2-1 Boot configuration

Boot mode configuration		Mode
nBOOT1 bit	BOOT0 pin	
X	0	Boot from Main flash
1	1	Boot from System memory
0	1	Boot from SRAM

The Boot loader is located in the System memory and is used to reprogram the Flash memory by using USART or USB interface.

2.4. Clock system

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. After the program is operating the system clock frequency and system clock source can be reconfigured. The frequency clocks that can be selected are:

- A 4/8/16/22.12/24 MHz configurable internal high precision HSI clock
- A 32.768 kHz configurable internal LSI clock
- A 4 to 32 MHz HSE clock, and used to enable the CSS function to detect HSE. If CSS fails, the hardware will automatically convert the system clock to HSI, and software configures the HSI frequency. Simultaneously, CPU NMI interrupt is generated.
- A 32.768 kHz LSE clock.
- PLL clock has HSI and HSE sources. If the HSE source is selected, when CSS is enabled and CSS fails, the PLL and HSE will be turned off, and the hardware selects the system clock source as HSI.

The AHB clock can be divided based on the system clock, and the APB clock can be divided based on the AHB clock. The maximum frequency of the AHB and the APB domains is 72 MHz.

2.5. Power management

2.5.1. Power block diagram

Figure 2-2 Power block diagram

Table 2-2 Power block diagram

No.	Power supply	Power value	Descriptions
1	V _{CC}	1.7 to 5.5 V	External power supply for I/Os and the internal regulator. It is provided externally through V _{CC} pins.
2	V _{CCA}	1.7 to 5.5 V	External analog power supply for ADC, DAC, COMP, OPA, LCD, RCs and PLL. It is provided externally through V _{CCA} pins.
3	V _{DDx} (V _{DDD} /V _{DDA})	1.2 V/1.0 V/0.9 V/0.8 V	VR supplies power to the main logic circuits and SRAM inside the chip. When the MR is powered, it outputs 1.2 V. According to the software configuration, when entering the Stop mode it powered by MR or LPR, and the LPR output is determined to be 1.2 V/1.0 V/0.9 V/0.8 V.

2.5.2. Power monitoring

2.5.2.1. Power on reset (POR/PDR)

The power-on reset (POR) and power-down reset (PDR) module is designed in the chip to provide power-on and power-off reset for the chip. The module keeps working in all modes.

2.5.2.2. Brown-out reset (BOR)

In addition to POR/ PDR, BOR (Brown-out reset) is also implemented. BOR can only be enabled and disabled through the option byte.

When the BOR is turned on, the BOR threshold can be selected by the option byte and both the rising and falling detection points can be individually configured.

Figure 2-3 POR/PDR/BOR threshold

2.5.2.3. Programmable voltage detector (PVD)

Programmable voltage detector (PVD) module can be used to detect the V_{CC} power supply and the voltage of the PB7 pin, and the detection point is configured through the register. When V_{CC} is higher or lower than the detection point of PVD, the corresponding reset flag is generated.

This event is internally connected to line 16 of EXTI, depending on the rising/falling edge configuration of EXTI line 16, when V_{CC} rises above the detection point of PVD, or V_{CC} falls below the detection point of PVD, an interrupt is generated. In the service program, users can perform urgent shutdown tasks.

Figure 2-4 PVD threshold

2.5.3. Voltage regulator

The regulator has two operating modes:

- Main regulator (MR) is used in normal operating mode(Run).
- Low power regulator (LPR) can be used in Stop mode where the power demand is reduced.

2.5.4. Low-power mode

In addition to the normal operating mode, the chip has 2 low-power modes:

- Sleep mode: Peripherals can be configured to keep working when the CPU clock is off (NVIC, SysTick, etc.). It is recommended only to enable the modules that must work, and close the module after the module works.
- Stop mode: In this mode, the contents of SRAM and registers are maintained, HSI and HSE are turned off, and most modules of clocks in the VDD domain are stopped. GPIO, PVD, COMP output, RTC and LPTIM can wake up Stop mode.

2.6. Reset

Two resets are designed in the chip: power reset and system reset.

2.6.1. Power reset

A power reset occurs in the following situations:

- Power-on/power-down reset (POR/PDR)
- Brown-out Reset (BOR)

2.6.2. System reset

A system reset occurs when the following events occur:

- Reset of NRST pin
- Windowed watchdog reset (WWDG)
- Independent watchdog reset (IWDG)
- SYSRESETREQ software reset
- Option byte load reset (OBL)

2.7. General-purpose inputs and outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. The I/O configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

2.8. Direct memory access controller (DMA)

Direct memory access (DMA) is used to provide a high-speed data transfer between peripherals and memory as well as from memory to memory. Data can be quickly moved by DMA without any CPU actions. This keeps the CPU resources free for other operations.

The DMA controller have 7 channels in total, each one dedicated to manage memory access requests from one or more peripherals. Each controller has an arbiter for handling the priority between DMA requests.

The DMA supports:

- Single AHB Master
- Support peripherals to memory, the memory to the peripherals, memory to memory and peripherals to peripheral data transmission
- On-chip memory devices, such as Flash, an SRAM, AHB and APB peripherals, as the source and target
- All DMA channel can be independent configuration:
 - Each channel is associated either with a DMA request signal from a peripheral or with a software trigger in a memory-to-memory transfer. This configuration is done by software.
 - The priority between requests is programmable by software (4 levels per channel: very high, high, medium and low) and, in equal cases, by hardware (such as a request for channel 1 taking precedence over a request for channel 2).
 - The transfer sizes of the source and destination are independent (byte, half word and word), simulating packing and unpacking. The source and destination addresses must be aligned by data size.
 - Programmable number of data to be transferred: 0 ~ 65535
- Each channel generates an interrupt request. Each interrupt request is caused by one of three DMA events: transfer completion, half-transfer, or transfer error.

2.9. Interrupts and events

The PY32F071-E handles exceptions through the Cortex-M0+ processor's embedded a nested vectored interrupt controller (NVIC) and an extended interrupt/event controller (EXTI).

2.9.1. Nested vectored interrupt controller (NVIC)

NVIC is a tightly coupled IP inside the Cortex-M0+ processor. The NVIC can handle NMI (Non-Maskable Interrupts) and maskable external interrupts from outside the processor and Cortex-M0+ internal exceptions. NVIC provides flexible priority management.

The tight coupling of the processor core to the NVIC greatly reduces the delay between an interrupt event and the initiation of the corresponding interrupt service routine (ISR). The ISR vectors are listed in a vector table, stored at a base address of the NVIC. The vector table base address determines the vector address of the ISR to execute, and the ISR is used as the offset composed of serial numbers.

If a higher-priority interrupt event occurs and a lower-priority interrupt event is just waiting to be serviced, the later-arriving higher-priority interrupt event will be serviced first. Another optimization is called tail-chaining. When returning from a higher-priority ISR and then starting a pending lower-priority ISR, unnecessary pushes and pops of processor contexts will be skipped. This reduces latency and improves power efficiency.

NVIC features:

- Low latency interrupt handling
- Level 4 interrupt priority
- Supports one NMI interrupt
- Support 32 maskable external interrupts
- High-priority interrupts can interrupt low-priority interrupt responses
- Support tail-chaining optimization
- Hardware interrupt vector retrieval

2.9.2. Extended interrupt/event controller (EXTI)

EXTI adds flexibility to handle physical wire events and generates wake-up events when the processor wakes up from Stop mode.

The EXTI controller has multiple channels, including a maximum of 16 GPIOs, 1 PVD output, 3 COMP outputs, RTC and LPTIM wake-up signals. GPIO, PVD and COMP can be configured to be triggered by a rising edge, falling edge or double edge. Any GPIO signal can be configured as EXTI0 to 15 channel through the select signal.

- Each EXTI line can be independently masked through registers.
- The EXTI controller can capture pulses shorter than the internal clock period.
- Registers in the EXTI controller latch each event. Even in Stop mode, after the processor wakes up from Stop mode, it can identify the wake-up source or identify the GPIO and event that caused the interrupt.

2.10. Analog-to-digital converter (ADC)

The 12-bit analog-to-digital converter has up to 16 external and 8 internal channels.

The ADC internal voltage reference: V_{REFBUF} (1.5 V, 2.048 V, 2.5 V) or the power supply voltage V_{CCA} .

The internal channels are: T_{S_VIN} , V_{REFINT} , $V_{CCA}/3$, OPA 1~3 and DAC 1~2.

- A/D conversion of the various channels can be performed in single, continuous, scan or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 16-bit data register.
- The analog watchdog feature allows the application to detect if the input voltage goes outside the user-defined higher or lower thresholds.
- An efficient low-power mode is implemented to allow very low consumption at low frequency.
- Analog watchdog for automatic voltage monitoring, generating interrupts and trigger for selected timers

2.11. Digital-to-analog converter (DAC)

The two 12-bit buffered DAC channels can be used to convert digital signals into analog voltage signal outputs. The DAC can be configured in 8-bit or 12-bit mode, or can be used in conjunction with a DMA controller. When the DAC is operating in 12-bit mode, the data can be left justified or right justified. The DAC module has two output channels, each with a separate converter. In dual-DAC mode, the two channels can be converted independently, or they can be converted simultaneously and update the output of the two channels synchronously. The main features are as follows:

- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- Support DMA underflow error detection
- External triggers for conversion

2.12. Comparators (COMP)

The COMP1/2/3 module can be used as a separate module or in combination with timer. Comparators can be used as:

- Triggered by analog signal to wake-up function from low-power mode
- Analog signal conditioning
- Cycle by cycle current control loop when comparators are connected with PWM output from timer.

COMP features are summarized as follows:

- Voltage comparison function is supported. Each comparator has configurable positive or negative input for flexible voltage selection:
 - Multiple I/O pins
 - 64 steps voltage of $V_{CCA}/V_{REFBUF}/V_{REF1P2}$
 - Temperature sensor output
 - DAC output
 - OPA output

- Programmable speed and power consumption
- Rail to Rail
- Hysteresis function
- The output can be triggered by a connection to the I/O or timer input
- Each COMP has interrupt generation capability and is used to wake up the chip from low power mode (Sleep/Stop) (via EXTI)
- Provides software to configure the digital filtering time to enhance the anti-interference capability of the chip
- Supports the Window Comp function

2.13. Operational amplifier (OPA)

The OPA1/2/3 module can be flexibly configured and is suitable for simple amplifiers. The three internal OPA can be cascaded using external resistors.

OPA features are summarized as follows:

- Three independently configured operational amps
- OPA input range is 0 to V_{CCA} , output range is 0.1 V to $V_{CCA} - 0.2$ V (demand) to simulate a module, a programmable gain
- Can be configured for the following models
 - General operational mode (general purpose OPA)

2.14. Liquid crystal display (LCD) controller

The LCD controller is a digital controller/driver for monochrome passive liquid crystal displays (LCD), with up to 8 common terminals (COM) and 40 segment terminals (SEG) to drive 160 (4 * 40) or 288 (8 * 36) LCD pixels. The exact number of terminals depends on the device pins described in the data manual. LCD functions are summarized as follows:

- Highly flexible frame rate control
- Support static, 1/2, 1/3, 1/4, 1/6, and 1/8 of a duty ratio
- Support static, 1/2, 1/3 bias voltage
- Up to 16 registers LCD data RAM
- By software configuration of LCD contrast
- 2 kinds of waveform generation
 - Internal resistance divider, external resistance divider
 - By way of internal resistance of the software configuration partial pressure power consumption, so as to match the capacitance charge needed for the LCD panel
- Support low power consumption modes: LCD controller can be on the Run, Sleep and Stop mode for display
- Configurable frame interrupt
- Support LCD flashing function and configuration of multiple flicker frequency
- Unused LCD segments and public pin can be configured to digital or analog functions

2.15. Hardware divider (DIV)

Hardware divider is a 32-bit signed/unsigned integer hardware divider.

DIV features:

- Support 32-bit division
- The data in the register cannot be changed while the current division is not finished
- Configurable signed/unsigned integer division calculation
- 32-bit divisor, 32-bit divisor
- Outputs 32-bit quotient and 32-bit remainder
- Divide-by-zero warning flag bit, end-of-division flag bit
- 8 clock cycles to complete a division operation
- Write the divisor register to trigger the start of the division circuit
- After writing the divisor, when reading the quotient and remainder registers, you need to wait for the completion flag DIV_END
- When the divisor is 0, the result of quotient and remainder is 0

2.16. Timers

Table 2-3 compares the features of the different timers.

Table 2-3 Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA	Capture /compare channels	Complementary outputs
Advanced control	TIM1	16-bit	Up, down, up/down	Integer from 1 to 65536	Yes	4	3
General purpose	TIM2	32-bit	Up, down, up/down	Integer from 1 to 65536	Yes	4	-
General purpose	TIM3	16-bit	Up, down, up/down	Integer from 1 to 65536	Yes	4	-
	TIM14	16-bit	Up	Integer from 1 to 65536	-	1	-
	TIM15	16-bit	Up	Integer from 1 to 65536	Yes	2	1
	TIM16 TIM17	16-bit	Up	Integer from 1 to 65536	Yes	1	1
Basic	TIM6 TIM7	16-bit	Up	Integer from 1 to 65536	Yes	-	-

2.16.1. Advanced-control timer (TIM1)

The advanced-control timer (TIM1) is consist of a 16-bit auto-reload counter driven by a programmable prescaler. It can be used in various scenarios, including pulse length measurement of input signals (input capture) or generating output waveforms (output compare, output PWM, complementary PWM with dead-time insertion).

The four independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned mode)

- Single pulse mode output

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers by the Timer Link feature for synchronization or event chaining.

TIM1 supports the DMA function.

2.16.2. General-purpose timers

2.16.2.1. TIM2/TIM3

The general-purpose timers TIM2/TIM3 are consist of 32/16-bit auto-reload counters and a 32/16-bit prescaler. There are four independent channels each for input capture/output compare, PWM or one-pulse mode output.

- They can work with the TIM1 by the Timer Link.
- TIM2/TIM3 supports DMA function.
- This timer is capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.
- The counter can be frozen in debug mode.

2.16.2.2. TIM14

- The general-purpose timer TIM14 is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM14 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- The counter can be frozen in debug mode.

2.16.2.3. TIM15/TIM16/TIM17

- The general-purpose timer (TIM15, TIM16 and TIM17) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM16/TIM17 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15 features two single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15/TIM16/TIM17 have complementary outputs with dead time.
- TIM15/TIM16/TIM17 supports DMA function.
- The counter can be frozen in debug mode.

2.16.3. Basic timers (TIM6/TIM7)

- The basic timer TIM6/TIM7 is consist of a 16-bit auto-reload upcounter driven by programmable prescaler respectively.
- Synchronization circuit to trigger DAC.

- Generate interrupt/DMA request on update event (counter overflow).

2.16.4. Low power timer (LPTIM)

- LPTIM is a 16 -bit upcounter with a 3-bit prescaler and support a continuous or single count.
- LPTIM can be configured as a Stop mode wake-up source.
- The counter can be frozen in debug mode.

2.16.5. Independent watchdog (IWDG)

Independent watchdog (IWDG) is integrated in the chip, and this module has the characteristics of high-security level, accurate timing and flexible use. IWDG finds and resolves functional confusion due to software failure and triggers a system reset when the counter reaches the specified timeout value.

- The IWDG is clocked by LSI, so even if the main clock fails, it can keep working.
- IWDG is the best suited for applications that require the watchdog as a standalone process outside of the main application and do not have high timing accuracy constraints.
- Controlling of option byte can enable IWDG hardware mode.
- IWDG is the wake-up source of Stop mode, which wakes up Stop mode by reset.
- The counter can be frozen in debug mode.

2.16.6. System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability, and the counter can be frozen in debug mode.

2.16.7. SysTick timer

SysTick timer is dedicated to real-time operating systems, but could also be used as a standard down counter.

SysTick features:

- A 24-bit down counter
- Auto-reload capability
- Maskable system interrupt generation when the counter reaches 0

2.17. Real-time clock (RTC)

The RTC is an independent counter. It has a set of continuous counting counters, which can provide a clock calendar function under the corresponding software configuration. Modifying the value of the counter can reset the current time and date of the system.

- RTC is a 32-bit programmable counter with a prescaler factor of up to 220 bits.
- The RTC counter clock source can be LSE,LSI and HSE/128.
- RTC can generate alarm interrupt, second interrupt and overflow interrupt (maskable).
- RTC supports clock calibration.
- RTC can be frozen in debug mode.

2.18. Cyclic redundancy check calculation unit(CRC)

CRC computing unit is based on a fixed generation polynomial to obtain 32-bit CRC computing results. In other applications, CRC technology is mainly used to verify the correctness and integrity of data transmission or data storage.

2.19. Clock trimming controller (CTC)

The clock trimming controller (CTC) uses hardware to automatically calibrate the RC crystal oscillator (HSI) when the internal configuration is 16 MHz, and uses the PLL (48 MHz) after 3 times the frequency as the clock source of the USB module. The CTC module calibrates the HSI clock frequency based on an external high-precision reference signal source, and adjusts the calibration value automatically or manually to obtain an accurate PLL48 MHz clock.

The CTC module performs the following functions:

- Three external reference sources: GPIO, LSE clock and USB_SOF.
- Provide software reference synchronization pulse.
- Hardware calibration automatically, no software operation.
- 16 bits calibration counter with reference source capture and overload capabilities.
- 8 bits clock calibration base value for frequency evaluation and automatic calibration.
- Flag bits and interrupts that indicate the state of clock calibration: calibration success state (CKOKIF), warning state (CKWARNIF), and error state (ERRIF).

2.20. System configuration controller (SYSCFG)

The SYSCFG module provides the following functions:

- Enable and disable I2C type IO filter
- Mapping the initial program area according to different boot modes
- DMA peripheral channel selection control
- TIMx cascade control
- Enable and disable PVD Lock
- Enable and disable Cortex-M0+ LOCKUP
- Enable and disable Noise filter for all GPIOs

2.21. Debug support (DBG)

The MCU DBG module assists the debugger with the following functions:

- Support Sleep mode and Stop mode
- When the CPU enters the HALT mode, the control timer or watchdog stops counting or continues counting
- Block I2C1 and I2C2 SMBUS timeouts when the CPU is in HALT mode
- Assigns tracking pins

The MCUIDBG register also provides chip ID encoding. This ID encoding can be accessed by a JTAG or SW debug interface, or by a user program.

2.22. Inter-integrated circuit interface (I²C)

The I²C (Inter-integrated circuit) bus interface handles communications between the microcontroller and the serial I²C bus. It provides multimaster capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing. It supports Standard-mode (Sm) and Fast-mode (Fm) .

I²C features:

- Two I²C Interfaces
- Multimaster capability : can be Master or Slave
- Support different communication speeds
 - Standard Mode (Sm): up to 100 kHz
 - Fast Mode (Fm): up to 400 kHz
- As Master
 - Generate Clock
 - Generation of Start and Stop
- As Slave
 - Programmable I²C address detection
 - Dual-address capability that responds to two secondary addresses
 - Discovery of the Stop bit
- 7-bit/10-bit addressing mode
- General call
- Status flag
 - Transmit/receive mode flags
 - Byte transfer complete flag
 - I²C busy flag bit
- Error flag
 - Master arbitration loss
 - ACK failure after address/data transfer
 - Start/Stop error
 - Overrun/Underrun (clock stretching function disable)
- Optional clock stretching
- Single-byte buffer with DMA capability
- Software reset
- Analog noise filter function
- Hardware PEC (packet error checking) generation and verification with ACK control
- Support SMBus

2.23. Universal synchronous/asynchronous receiver transmitter (USART)

PY32F071-E contains 4 USARTs, two of USARTs (USART1 and USART2) support ISO7816, LIN, and IrDA.

The USARTs provide a flexible method for full-duplex data exchange with external devices using the industry-standard NRZ asynchronous serial data format. The USART utilizes a fractional baud rate generator to provide a wide range of baud rate options.

It supports simultaneous one-way communication and half-duplex single-wire communication, and it also allows multi-processor communication.

Automatic baud rate detection is supported.

High-speed data communication can be achieved by using the DMA method of the multi-buffer configuration.

USARTs features:

- Full-duplex asynchronous communication
- NRZ standard format
- Configurable 16 times or 8 times oversampling for increased flexibility in speed and clock tolerance
- Programmable baud rate shared by transmit and receive, up to 4.5 Mbit/s
- Automatic baud rate detection
- Programmable data length of 8 or 9 bits
- Configurable stop bits (0.5, 1, 1 or 2 bits)
- Synchronous mode and clock output function for synchronous communication
- Single-wire half-duplex communication
- Independent transmit and receive enable bits
- Hardware flow control
- Receive/transmit bytes by DMA buffer
- Detection flag
 - Receive full buffer
 - Send empty buffer
 - End of transmission
- Parity control
 - Send check digit
 - Check the received data
- Flagged interrupt sources
 - CTS change
 - Send empty register
 - Send completed
 - Receive full data register
 - Bus idle detected
 - Overflow error
 - Frame error
 - Noise operation

- Error detection
- Multiprocessor communication
 - If the address does not match, enter silent mode
- Wake-up from silent mode: by idle detection and address flag detection

2.24. Serial peripheral interface (SPI)

PY32F071-E contains two SPIs. SPIs allow the chip to communicate with external devices in half-duplex, full-duplex, and simplex synchronous serial communication. This interface can be configured in Master mode and provides the serial clock (SCK) for external slave devices. The interface can also work in a multi-master configuration.

The SPI features are as follows:

- Master or Slave mode
- 3-wire full-duplex simultaneous transmission
- 2-wire half-duplex synchronous transmission (with bidirectional data line)
- 2-wire simplex synchronous transmission (no bidirectional data line)
- 8-bit or 16-bit transmission frame selection
- Support multi-master mode
- 8 Master mode baud rate prescale factors (Max $f_{PCLK}/2$)
- Slave mode frequency (Max $f_{PCLK}/4$)
- Both Master and Slave modes can be managed by software or hardware NSS: dynamic change of Master/Slave operating mode
- Programmable clock polarity and phase
- Programmable data order, MSB first or LSB first
- Dedicated transmit and receive flags that can trigger interrupts
- SPI bus busy status flag
- Motorola mode
- Interrupt-causing Master mode faults or overloads
- Two 32-bit Rx and Tx FIFOs with DMA capability

2.25. USB 2.0 full-speed module

PY32F071-E contains 1 USB 2.0 full speed module. USB peripheral implements the interface between USB2.0 full speed bus and APB1 bus. It supports USB suspend/restore operation and can stop the device clock to achieve low power consumption. The main features are as follows:

- Comply with the technical specifications of USB 2.0 full speed devices
- It can be configured with 1 to 6 USB endpoints
- CRC (cyclic redundancy check) generation/check, reverse non-return to zero inverted (NRZI) encoding/decoding and bit filling
- Support control transmission/synchronous transmission/batch transmission/interrupt transmission
- Support a dual buffer mechanism for batch/synchronous endpoints
- USB suspend and restore operations are supported

- Frame lock clock pulse generation
- Dedicated 1024 Bytes packet cache storage

2.26. Serial wire debug (SWD)

An ARM SWD interface allows serial debugging tools to be connected to the PY32F071-E.

1. Configured by option bytes to choose PF2 or NRST.
2. After reset, PA13 and PA14 are configured as SWDIO and SWCLK AF functions, the former has an internal pull-up resistor and the latter has an internal pull-down resistor activated.
3. PF8-BOOT0 defaults to digital input mode and pull-down is enabled.

5. Electrical characteristics

5.1. Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS} .

5.1.1. Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^{\circ}\text{C}$ and $T_A = T_A(\text{max})$ (given by the selected temperature range).

Data based on electrical characterization results, design simulations and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation.

5.1.2. Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^{\circ}\text{C}$ and $V_{CC} = 3.3\text{ V}$. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated.

5.1.3. Power supply scheme

Figure 5-1 Power supply scheme

5.2. Absolute maximum ratings

Stresses above the absolute maximum ratings listed in following tables may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5-1 Voltage characteristics ⁽¹⁾

Symbol	Ratings	Min	Max	Unit
$V_{CC}-V_{SS}$	External mains power supply	-0.3	6.25	V
V_{IN}	Input voltage of other pins	-0.3	$V_{CC}+0.3$	V

1. All main power (V_{CC} , V_{CCA}) and ground (V_{SS} , V_{SSA}) pins must always be connected to the external power supply, in the permitted range.

Table 5-2 Current characteristics

Symbol ⁽²⁾	Ratings	Max	Unit
ΣI_{VCC}	Total current into sum of all V_{CC} power lines (source) ⁽¹⁾	170	mA
ΣI_{VSS}	Total current out of sum of all V_{SS} ground lines (sink) ⁽¹⁾	170	mA
$I_{IO(PIN)}$ ⁽²⁾	Output current sunk by any I/O and control pin	20	mA
	Output current source by any I/Os and control pin	20	
$\Sigma I_{IO(PIN)}$ ⁽²⁾	Total output current sunk by sum of all I/Os and control pins	150	mA
	Total output current sourced by sum of all I/Os and control pins	150	

1. Power supply V_{CC} and ground V_{SS} pins must always be connected to the external power supply within the allowable range.
2. These I/O types refer to the terms and symbols defined by pins.

Table 5-3 Thermal characteristics

1. Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.
2. Guaranteed by design, not tested in production.
3. $t_{SU(HSE)}$ is the startup time from enable (by software) to when the clock oscillation reaches a stable state, measured for a standard crystal/resonator, which can vary considerably from one crystal/resonator to another.
4. Data based on characterization results, not tested in production.

5.3.6.4. Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

3. Equation 1: R_{AIN} max formula

$$4. R_{AIN} < \frac{T_s}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above (*Equation 1*) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

5.3.23. Communication interfaces

5.3.23.1. I²C interface characteristics

The I²C interface meets the timing requirements of the I²C-bus specification and user manual:

- Standard-mode (Sm): up to 100 kbit/s
- Fast-mode (Fm): up to 400 kbit/s

I²C SDA and SCL pins have analogue filtering, see table below.
